Name of Student : Raghav Mahesh Sarda	**PRN:** 25070122***235***
Subject: Programming with Java	**Semester: III**
ASSIGNMENT No : 9	**Year: AY 2026-27**
TITLE : Final Keyword In Java	

Problem Statement

Write a Java program to demonstrate the use of the final keyword with variables, methods, and classes.

Learning Objectives

To implement the final keyword with variables, methods, and classes.

Program:

BankAccount.java

```
// Assignment 9 - Exercise 1: Bank Account using final variable
import java.util.*;
public class BankAccount
{
   final int accNo; // Final variable declaration
   String name;
   double balance;

   BankAccount(int a, String n, double b) // Constructor
   {
       accNo=a; // Initializing final variable
       name=n;
       balance=b;
   }
   void display() // Display method
   {
       System.out.println("\n-- Account Details --");
       System.out.println("Account No (Final): " + accNo);
       System.out.println("Holder Name: " + name);
       System.out.println("Balance: $" + balance);
   }
```

```
    public static void main(String args[]) // Main Method
    {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter Account Number: ");
        int an = sc.nextInt();
        sc.nextLine(); // Consuming newline

        System.out.print("Enter Account Holder Name: ");
        String hn = sc.nextLine();

        System.out.print("Enter Opening Balance: ");
        double bl = sc.nextDouble();

        BankAccount acc = new BankAccount(an, hn, bl); // Creating object
        acc.display(); // Displaying account details

        // acc.accNo = 12345; // Will give an error, as we cannot assign
a value to the final variable
        sc.close();
    }
}
```

LibraryBookManagementSystem.java

```
// Assignment 9 - Exercise 2: Library Book Management using final class
and method
import java.util.*;
final class LibraryBook // Final class (cannot be inherited)
{
   final String isbn; // Final variable
   String title;
   String author;
   double price;
   LibraryBook(String i, String t, String a, double p) // Constructor
   {
       isbn=i;
       title=t;
       author=a;
       price=p;
   }
   final void display() // Final method (cannot be overridden)
   {
       System.out.println("\n--- Book Details ---");
       System.out.println("ISBN: " + isbn);
       System.out.println("Title: " + title);
       System.out.println("Author: " + author);
       System.out.println("Price: $" + price);
   }
}

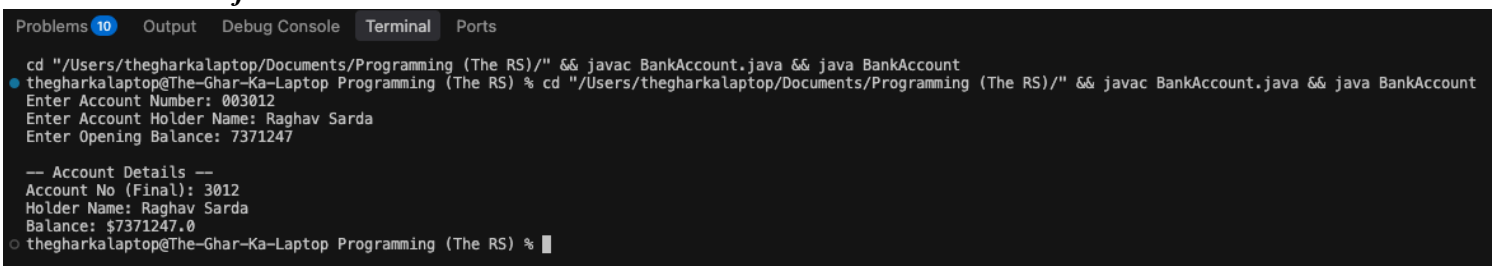

public class LibraryBookManagementSystem
{
   public static void main(String args[]) // Main method
   {
       Scanner sc = new Scanner(System.in);
       System.out.print("Enter Book ISBN: ");
       String i = sc.nextLine();
       System.out.print("Enter Book Title: ");
       String t = sc.nextLine();
       System.out.print("Enter Book Author: ");
       String a = sc.nextLine();
       System.out.print("Enter Book Price: ");
       double p = sc.nextDouble();

       LibraryBook book = new LibraryBook(i, t, a, p); // Creating final
class object
       book.display(); // Displaying book details
```

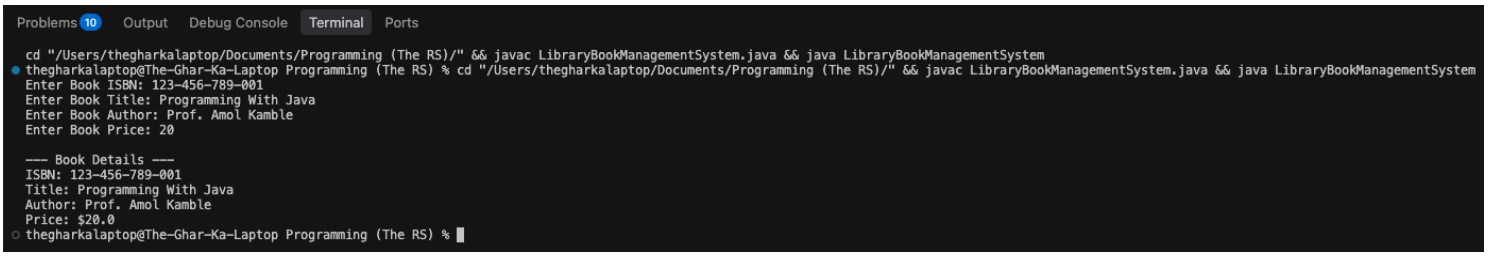

```
        sc.close(); // Closing scanner
    }
}
```

Output:

BankAccount.java

LibraryBookManagementSystem.java

Conclusion:

In this assignment, the final keyword was successfully implemented to restrict modification across variables, methods, and classes. It ensured constant data assignments like account numbers and ISBNs, while applying it to methods and classes, and prevented unintended method overriding and class inheritance.
