Name of Student : Raghav Mahesh Sarda	**PRN:** 25070122***235***
Subject: Programming with Java	**Semester: III**
ASSIGNMENT No : 8	**Year: AY 2026-27**
TITLE : Super Keyword In Java	

Problem Statement

Write a Java program to demonstrate the use of the super keyword in inheritance.

Learning Objectives

To demonstrate the use of the super keyword for accessing parent class members.

Program:

EmployeeManagerSuperKeyword.java

```
// Assignment 8 - Exercise 1: Employee and Manager using super keyword
import java.util.*;
class Employee // Parent class
{
   String name;
   int id;
   Employee(String n, int i) // Parent constructor
   {
       name=n;
       id=i;
   }
   void display() // Parent display method
   {
       System.out.println("\n-- Employee Details --");
       System.out.println("ID: " +id);
       System.out.println("Name: " +name);
   }
}

class Manager extends Employee // Child class
{
```

```
    double bonus;
    Manager(String n, int i, double b) // Child constructor
    {
        super(n, i); // Calling parent constructor using super
        bonus = b;
    }
    void display() // Child display method overriding parent
    {
        super.display(); // Calling parent method using super
        System.out.println("Bonus: $" + bonus);
    }
}

public class EmployeeManagerSuperKeyword
{
    public static void main(String args[]) // Main Method
    {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter Manager ID: ");
        int mid = sc.nextInt();
        sc.nextLine(); // Consuming leftover newline
        System.out.print("Enter Manager Name: ");
        String mname = sc.nextLine();
        System.out.print("Enter Manager Bonus: ");
        double mbon = sc.nextDouble();

        Manager m = new Manager(mname, mid, mbon); // Creating manager
object
        m.display(); // Displaying details
        sc.close();
    }
}
```

Vehicle.java

```
// Assignment 8 - Exercise 2: Vehicle Insurance System using super
keyword
import java.util.*;
class Vehicle // Parent class
{
    String regNo;
    String brand;
    Vehicle(String r, String b) // Parent constructor
    {
```

```
        regNo=r;
        brand=b;
    }
}

class Insurance extends Vehicle // Child class
{
    String policyNo;
    double premium;
    Insurance(String r, String b, String p, double amt) // Child
constructor
    {
        super(r, b); // Calling parent constructor using super
        policyNo = p;
        premium = amt;
    }
    void showDetails() // Method to display all details
    {
        System.out.println("\n-- Insurance Details --");
        System.out.println("Vehicle Reg No: " + super.regNo); //
Accessing parent variable using super
        System.out.println("Vehicle Brand: " + super.brand); // Accessing
parent variable using super
        System.out.println("Policy Number: " + policyNo);
        System.out.println("Premium Amount: $" + premium);
    }
}

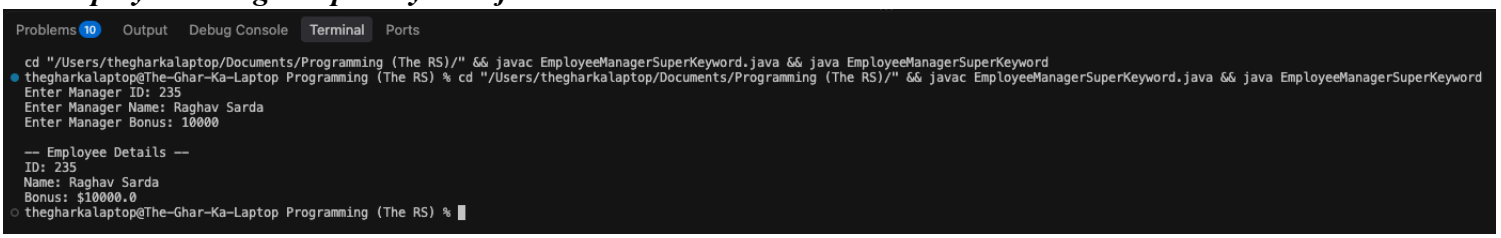

public class VehicleInsuranceSystem
{
    public static void main(String args[]) // Main Method
    {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter Vehicle Registration No: ");
        String vr = sc.next();
        System.out.print("Enter Vehicle Brand: ");
        String vb = sc.next();
        System.out.print("Enter Policy Number: ");
        String ip = sc.next();
        System.out.print("Enter Premium Amount: ");
        double ia = sc.nextDouble();

        Insurance ins = new Insurance(vr, vb, ip, ia); // Creating child
object
```

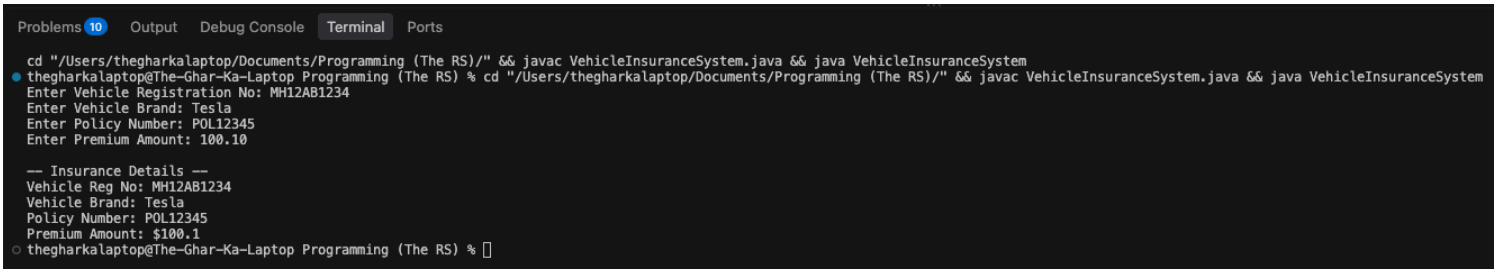

```
        ins.showDetails(); // Displaying details
        sc.close(); // Closing scanner
    }
}
```

Output:

EmployeeManagerSuperKeyword.java

Vehicle.java

Conclusion:

In this assignment, the super keyword was utilized to resolve naming conflicts, invoke parent class constructors, and access parent class methods and properties within a child class. This demonstrated how inheritance hierarchies can be effectively managed while maintaining organized object initialization.
